M2 IASD RESEARCH PROTOTYPE

RiskSignal

An LLM-assisted risk investigation workspace.

Ask a question. Connect the evidence.
Explore financial what-ifs. Keep the analyst in charge.

ONE SYSTEM. THREE STEPS.

01 **Observe**

Spot a concern in incidents, indicators or supplier links.

02 **Ask the investigator**

A live LLM can select read-only tools and draft an evidence-based summary.

03 **Explore and review**

Python runs Monte Carlo; the analyst checks assumptions and chooses follow-up.

Way forward

With a bank partner: evaluate LLM answers using approved sources, test analyst usefulness, and assess probabilistic loss forecasting with real data. Proposed research, not demonstrated results.

See the workflow in five minutes.

One fictional payment system. Your perspective on the next useful test.

Synthetic data; illustrative simulations; not a validated forecast or production tool.
Offline demo: scripted, not a live LLM. Live-model quality remains unevaluated.
